# GREETINGS EARTHLINGS

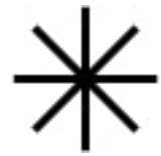

The CAD/CAM workflow has allowed labs across your planet to work faster, more accurate, and opened up a new world of innovative materials to be used in dental restorations. Getting the most out of this hi-tech revolution requires hi-tech tools....and this is where we have come to help.

AlienTools is focused on bringing you top quality milling tools to help in your quest of taking over the dental world.

We source only premium carbide, and machine the tools exclusively on industry-leading Swiss mills. Our innovative geometries combined with real diamond coating using **FLATCOAT™** technologies results in efficient chip removal and amazingly accurate results while milling with a variety of materials used in the dental world.

The results of this focus on quality: futuristic tools with incredible lifespans.

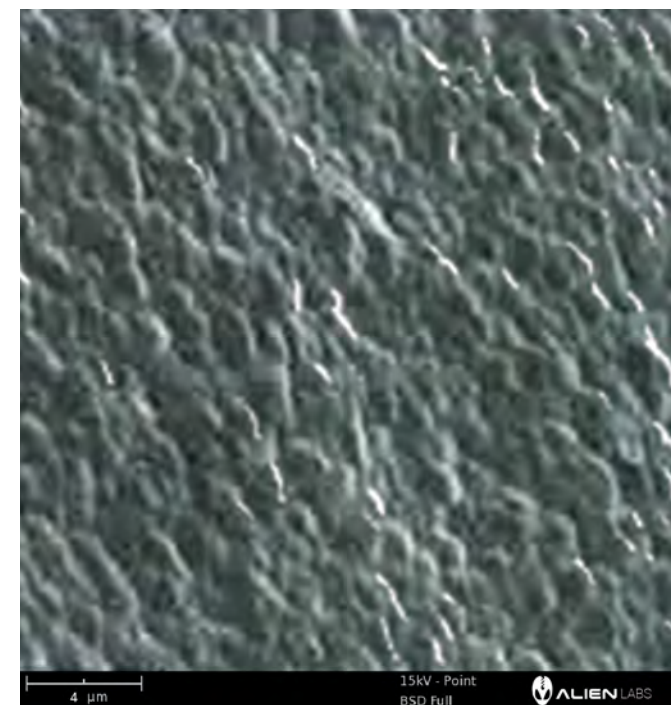

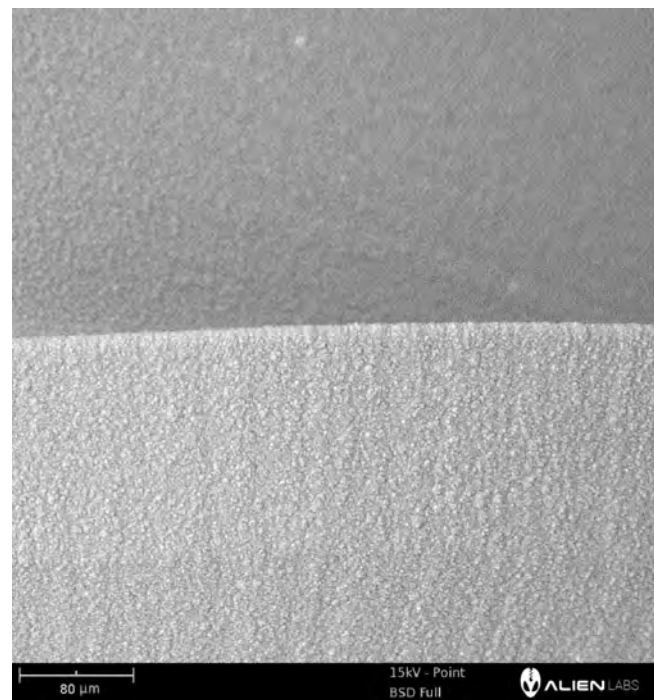

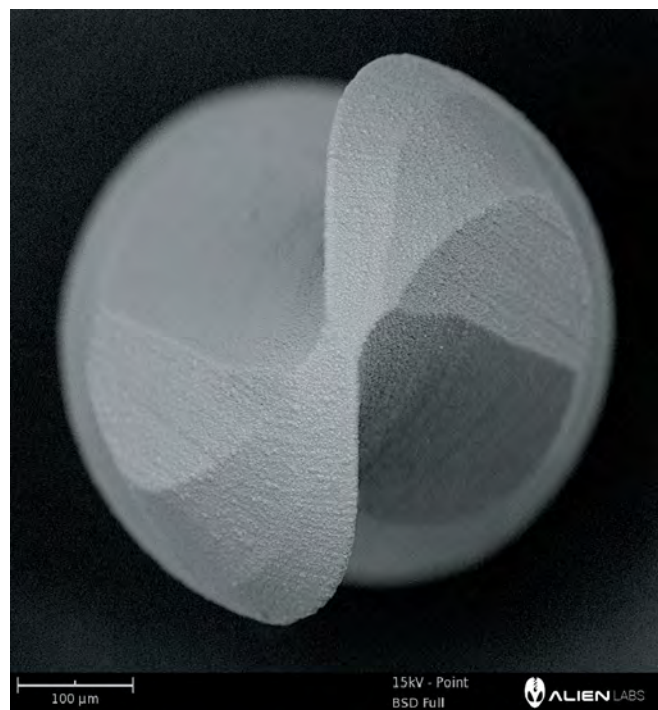

Accept only real diamond coating... 'diamond-like' is not worthy.

Our futuristic real diamond coating is manufactured using **FLATCOAT™** technology, a new multi-layer diamond coating technique ensuring that each coating is perfectly distributed across all cutting surfaces..

This optimized coating which gives the tool a Vicker's Hardness of 10,000 HV means for you less chipping, increased efficiency, and an amazing lifespan.

# FLATCOAT™

Most humans have learned that many manufacturers claim their burs have a diamond coating, but in fact have only diamond-like carbide coatings (DLC). What many of your planet have not yet learned is that there is even a large difference between the quality of different real diamond coatings that can have a dramatic effect on both the performance and lifespan of the tools.

All of our real diamond coatings are made with **FLATCOAT™** technology, a futuristic multilayer technique combining alternating levels of real diamond nano-crystals and micro-crystals. The result...a much flatter surface, reducing chipping during milling as well as a far longer lifespan due to the layers acting as a safeguard against damage to the coating going all the way to the carbide.

See the comparison to the right and it will be clear as to why **FLATCOAT™** has changed the milling tool industry.

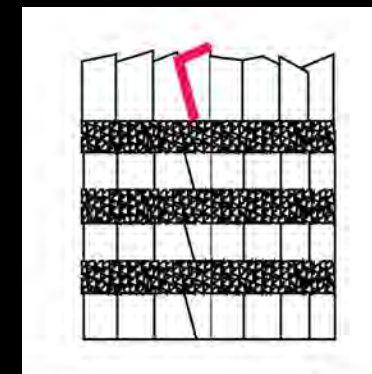

## FLATCOAT™

Closeup of Regular Surface

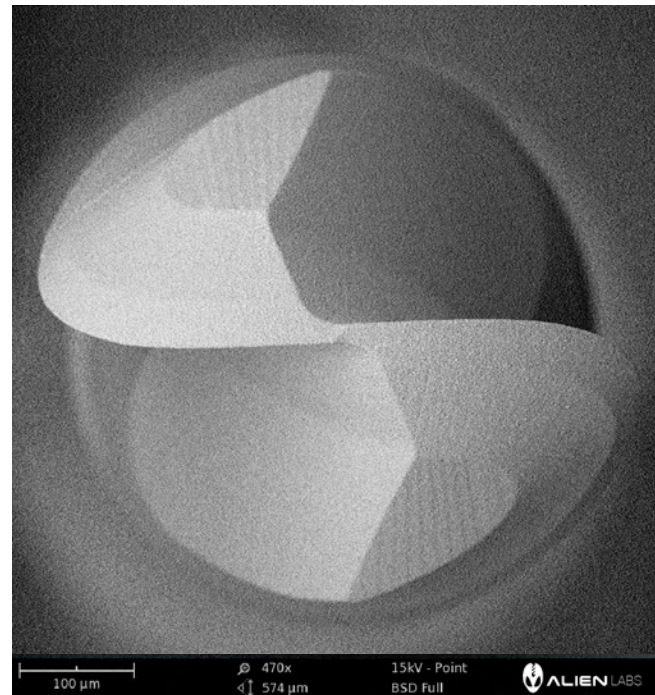

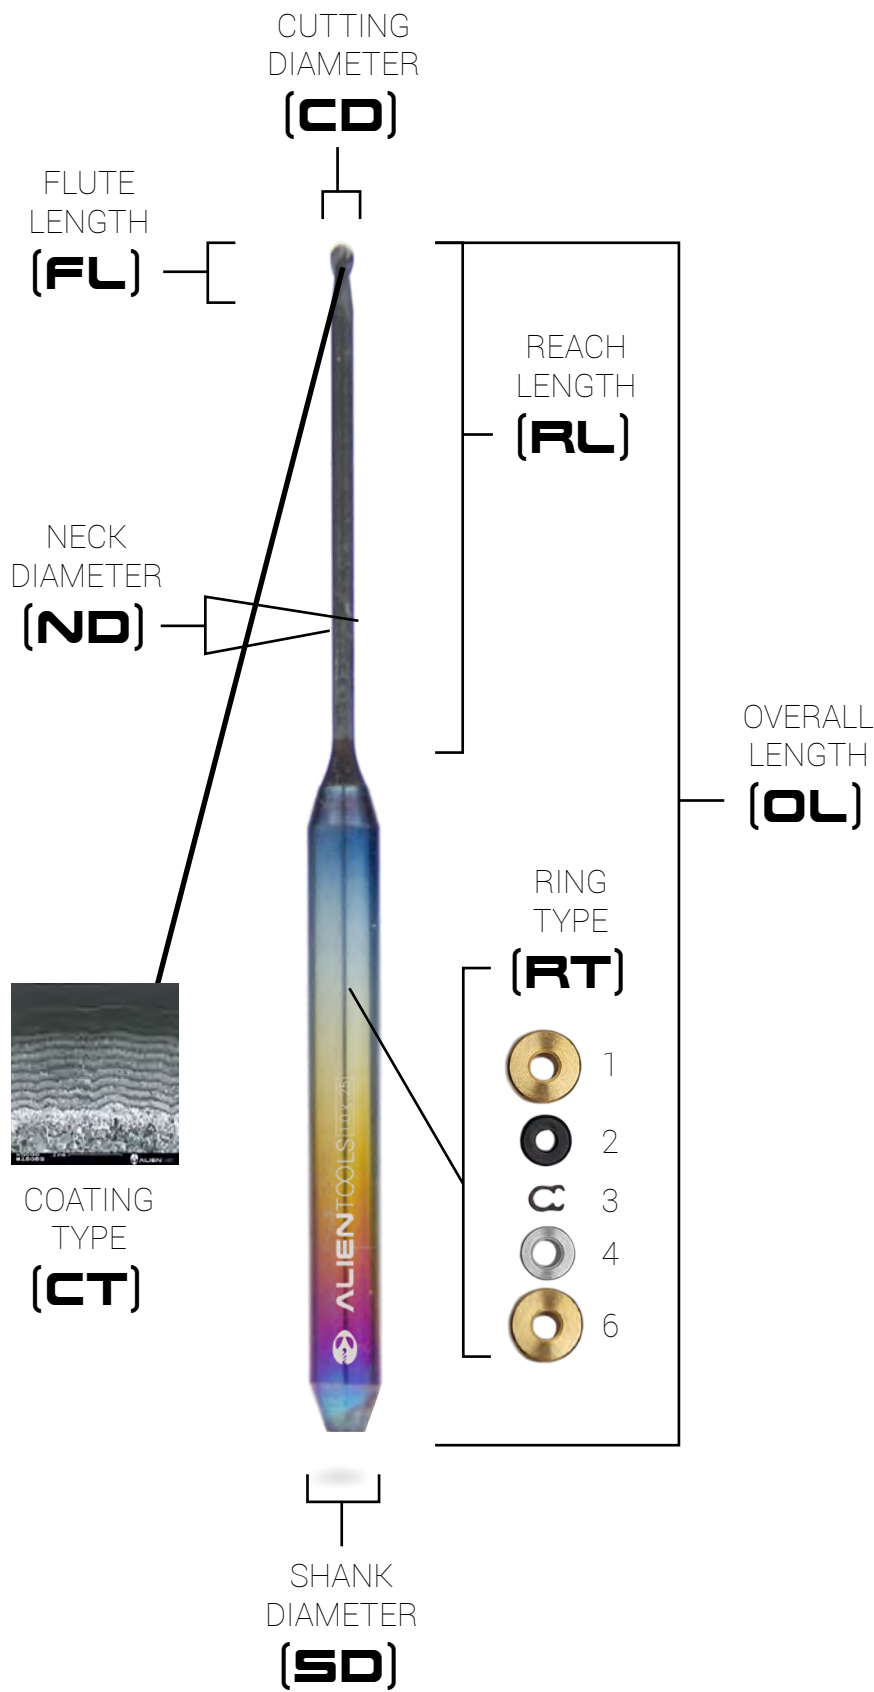

Possibility of Breaking to Carbide

Another common cause of chipping is the build-up of milled material in the tool. This is where our advanced technology enables us to create futuristic geometries that efficiently disperse the milled material.

This 'self-cleaning' process leaves the bur with a clean workspace, allowing it to freely mill more aggressively while reducing the possibility of chipping.
